

HOW DOES ABC FIRE EXTINGUISHER WORKS

An ABC powder fire extinguisher is a versatile and essential firefighting tool designed to tackle a wide range of fire types, including Class A (solid combustibles like wood, paper, and textiles), Class B (flammable liquids such as oil, gasoline, and solvents), and Class C (flammable gases and electrical fires). It operates by discharging a fine, dry chemical powder—primarily monoammonium phosphate—stored under pressure within the extinguisher. Upon activation, the powder is propelled by compressed gas, typically nitrogen, and directed through a nozzle or hose to the fire.

For Class A fires, the powder works by forming a coating over the burning material, cutting off the oxygen supply, and cooling the surface to prevent re-ignition. In the case of Class B fires, it disrupts the chemical chain reaction of combustion, effectively smothering the flames and preventing the spread of flammable vapors. When used on Class C fires involving electrical equipment or gases, the non-conductive properties of the powder allow for safe suppression of flames without the risk of electric shock.

PERFORMANCE DATA

Type	25Kg GX01 - 250TP
Out-diameter	300 mm
Cylinder Height	650 mm
Cylinder Weight	24kg
Dry Powder Weight	25Kg
Extinguisher Weight	50kg
Temperature Range	-30°C ~ +60°C
Max Working Pressure	14Bar
Test Pressure	25Bar
Material	St12
Carton size	40 x 60 x 90Cm/1pc
Gross Weight	50 Kg
